

■ REAL-TIME TRAFFIC & ACCIDENT ALERT SYSTEM

IoT-based monitoring system for real-time traffic analysis, automatic accident detection and instant email notification

SHORT CONCEPT

The system continuously monitors vehicle movement and road conditions using sensors and a camera module. An **ESP8266** processes the collected information, monitors traffic density and provides a web-based interface. When an accident is detected, the camera captures the relevant image, accident details are digitally logged, and an automatic **SMTP email alert** is sent for faster emergency response.

SYSTEM BLOCK DIAGRAM

KEY FEATURES

Real-time traffic monitoring • Automatic accident detection • Camera-based capture • Instant email alerts • Digital accident logging • Web-based monitoring • Low-cost IoT solution

TECHNOLOGIES: ESP8266 • Sensors • Camera Module • Arduino IDE • Embedded C • Web Server • SMTP

Project: NPR College of Engineering and Technology – Department of Electronics & Communication Engineering
